

# Secure Data Management: Second VLDB Workshop, SDM 2005, Trondheim, Norway, August 30-September 2, 2005, Proceedings (Lecture Notes in Computer Science ... Applications, incl. Internet/Web, and HCI)

Although cryptography and security techniques have been around for quite some time, emerging technologies such as ubiquitous computing and ambient intelligence that exploit increasingly interconnected networks, mobility and personalization put new requirements on security with respect to data management. As data is accessible anytime anywhere, according to these new concepts, it becomes much easier to get unauthorized data access. Furthermore, it becomes simpler to collect, store, and search personal information and endanger people's privacy. Therefore, research in the area of secure data management is of growing importance, attracting the attention of both the data management and security research communities. The interesting problems range from traditional ones, such as access control (with all variations, like dynamic, context-aware, role-based), database security (e.g., efficient database encryption schemes, search over encrypted data, etc.), and privacy-preserving data mining to controlled sharing of data. In addition to the aforementioned subject, this year we also called for papers devoted to secure data management in healthcare as a domain where data security and privacy issues are traditionally important. The call for papers attracted 38 papers both from universities and industry. The Program Committee selected 16 research papers for presentation at the workshop. These papers are also collected in this volume which we hope will serve you as a useful research and reference material.
