

Advances in Cryptology 1981 - 1997: Electronic Proceedings and Index of the CRYPTO and EUROCRYPT Conference, 1981 - 1997 (Lecture Notes in Computer Science)

About Cryptology It is now widely perceived that we are experiencing an information revolution whose effects will ultimately be as pervasive and profound as was brought by the industrial revolution of the last century. From the beginning of time, information has been an important asset for humans. In the early days of human existence, the mere knowledge of where to most easily gather food was the difference between life and death. Throughout history, information has provided the means for winning wars, making fortunes, and shaping history. The underlying theme of the information revolution is that we continue to find new ways to use information. These new uses for information serve to highlight our need to protect different aspects of information. Cryptology may be broadly defined as the scientific study of adversarial information protection. Cryptology has traditionally dealt with the confidentiality of information, but innovation in using information produces new requirements for protection of that information. Some are longstanding and fundamental - how do we guarantee that information is authentic? How do we guarantee that information is timely? How can we produce bits that have the same properties as money? Each of these questions has been grappled with in the cryptologic research community.
