

Immune and Defensive Corporate Systems

In the monograph the authors describe the applicability of the autonomous and profound research of the issues of designing new mathematical models for the estimation of the ADPS security, especially the factors that are conditioning the ADPS security, like:

- Obviousness and operativeness of making multi-alternative solutions on the ADPS security;
- Presence of possibilities to check the semantic relations and ADPS compatibility, data protection facilities and attack countering;
- Variety of forms and methods of detailed evaluation of attack graphs (scenarios) on ADPS and countering with them;
- Embedded facilities of the a priori processing of subject and object roles in the future processes of ADPS functioning under attacks.
